Feedback Round #1 – February 26 th , 2025
Hi-yahs! (things that are awesome!)
• The music is very interesting and well-implemented! • The game is fun to play! I like the concept. • The graphics are cool and all seem fitting!
Bugs (things to be improved)
Overall Game Play • (See Screenshot 1) Sometimes when the player gets stuck, like along a wall, they just can't move away if turned around, even after resetting location. Consider adding a reset round button as well. • The car is a bit too light and easy to flip, consider making it a bit heavier and changing the friction/drag values to help this. • The ball is too heavy and hard to push around, consider making it a bit lighter. • (See Screenshot 3) If you hit slow too much it allows the player to get infinite points by going into the negatives. • (See Screenshot 4) Trying to boost on the boss stage results in this error. If it's not implemented on this level then make sure to remove the control when on the boss level. • The control key on WebGL can sometimes activate other shortcuts. For example, holding control and W closes the window. Consider switching the boost to a different key. • The boost slider changes when dragging it with the mouse pointer, and then once clicked changes with the A and D keys.
UI / UX • (See Screenshot 2) The Modes screen is shown at the bottom of the screen, make sure to anchor the sides of the main menu so that only the screen you want to show is showing!
Code • A Unity package is required for code to be reviewed. Make sure to submit a valid unity package link. The WebGL build files were submitted on the form.
Whomp-whomps! (things that are missing)
• Make sure to add a credits screen to the main menu that lists your name as the creator as well as links to where all of the art, models, and music came from! • Consider adding a way to return to the main menu while playing the game so the player can stop playing at any time.
